Reflection:

- What was the most confusing step
Determining the code's error is the most challenging stage. We are having a lot of trouble figuring out the error and how to fix it. Specifically, when we attempt to start the application in step 6, an error happens and we are clueless of what to do.
- What did you learn about `findViewById` and listeners?
At first, we had no idea what `findViewById` and listeners were until we saw an error saying the id could not be found. We then learned that `findViewById` is used to connect the XML layout views (like Buttons and TextViews) to our Java code. We also learned that listeners let us respond to user actions, such as clicking a button.
- If you got an error, how did you fix it?
We carefully review the code, look for errors, and identify what is missing.
